DECLARATION BY STUDENTS

We hereby declare that this project work titled “**EVENT-EASE**” has been prepared by us during the academic year 2022 – 23 under the guidance of **Mrs Vanaja A**, Assistant Professor, Department of Computer Science, Application & Animation, St Aloysius College (Autonomous), Mangaluru submitted in partial fulfillment of the requirements for the award of the degree of **Bachelor of Computer Application (BCA)** as prescribed by the College.

We also declare that this project is the outcome of our efforts, that it has not been submitted to any other University for the award of any degree or diploma.

Ms Gretta Gonsalves – 204736

Ms Valina Mendonca – 204762

Mr Siril Joseph – 204792

TO WHOMSOEVER IT MAY CONCERN

This is to certify that the following students studying in VI Semester BCA, of St Aloysius College (Autonomous), Mangaluru during the academic year 2022–23 have done their project on the topic titled “**EVENT-EASE**” for the purpose of partial requirements for the award of the degree of Bachelor of Computer Application (BCA).

They have collected information from us and have satisfactorily completed the project under our guidance during the period from January 2023 to May 2023. During this tenure, their conduct and character was found good.

MS GRETТА GONSALVES – 204736
MS VALINA MENDONCA – 204762
MR SIRIL JOSEPH – 204792

Thanking You,

Yours truly

Mr Sagar Shetty

A handwritten signature in black ink, appearing to read 'Sagar Shetty', with a stylized flourish at the end.

Place: Mangaluru

Date: 02/05/2023

ACKNOWLEDGEMENT

We would like to express our sincere gratitude to all those who have contributed to the successful completion of our final year project on the event management system named Event-Ease. This project has been an exciting and a challenging journey, and we are thankful for the support and guidance we received along the way.

First and foremost, we would like to thank Almighty God for blessing us with the strength, knowledge, and perseverance to complete this project successfully.

We are grateful to our Principal, Rev. Dr Praveen Martis, SJ, for providing us with the opportunity to work and for supporting us throughout the project.

We would like to extend our heartfelt appreciation to the Dean and HOD of our department for their constant support, valuable suggestions, and encouragement throughout the project.

We would like to thank our external guide for their valuable guidance, support throughout the project. Their expertise, feedback, and insights have been instrumental in shaping this project.

We would also like to express my gratitude to our internal guide for their invaluable guidance and support. Their valuable suggestions and encouragement have been significant in helping us complete this project successfully.

We would like to extend our sincere thanks to the other staff members of our department for their valuable suggestions, support, and encouragement throughout the project.

We are grateful to our classmates and friends for their support and motivation throughout the project. Their valuable feedback and suggestions have been instrumental in shaping this project.

Finally, We would like to express my heartfelt gratitude to our parents, family members, well-wishers, and others who have supported us throughout this project. Their constant support and encouragement have been a source of inspiration for us.

MS GRETTA GONSALVES – 204736

MS VALINA MENDONCA – 204762

MR SIRIL JOSEPH – 204792

SYNOPSIS

1.1 Title of the Project

Event-Ease

1.2 Abstract

Event-Ease is an event management system which includes public as well as private events and aims to provide various users with a platform that can be used to create and book events with ease. Event-Ease also allows service providers to register and offer their services to manage the events. The basic features of this system include user profile management, event booking, ticket sales, service booking, report generation, etc. Services provided include catering, photography, decoration, etc. The website administrator will also have access to an admin dashboard for managing the website, public/private events, user accounts and other services.

1.3 Objective of the Project .

1. To provide easy options for booking events, selecting other services like decorations, catering, photography and making payments for the necessary tickets and others as per requirements.
2. To provide an event management module for managing all the aspects of the event like attendees, vendors or service providers and more.
3. To provide report generation for events and other services.
4. To easily integrate other services like decorations, catering, photography along with the platform.
5. To provide gallery management, user profile management, and ticket sales management.
6. To provide an admin dashboard for managing the user accounts, events, and other services.
7. To make the platform accessible via web browsers on mobile, tablet, and desktop devices.

1.4 Project Category

Web Based Application

1.5 Language(s) to be Used

1.5.1 Frontend Languages: HTML, CSS, JavaScript, and it's frameworks

1.5.2 Backend Languages: PHP

1.5.3 Database: MySQL

1.6 Structure of the Proposed Project

The proposed system aims to provide a comprehensive web application that offers an all-in-one platform for event management. With this platform, users will have access to a range of tools that are essential for successful event planning and execution. These tools will include options for becoming a service provider, managing all aspects of events, and even purchasing tickets for public events or booking other private events. The technology stack is chosen to provide robustness, scalability, and security to the platform.

1.6.1 User Management Module:

1. User registration and login system
2. User profile management
3. User role and access management

1.6.2 Public Event Management Module:

1. Event creation and scheduling
2. Managing ticket sale and commission

1.6.3 Private Event Management Module:

1. Event creation and scheduling
2. Event booking and payment management
3. Additional services booking and management (decorations, catering, photography, etc.)

4. Event cancellation and refund management
5. Attendees, sponsors, vendors management

1.6.4 Gallery Management Module:

1. Uploading and managing images and videos
2. Image and video tagging and categorization

1.6.5 Technology Stack:

1. Frontend: HTML, CSS, JavaScript
2. Backend: PHP
3. Cloud Hosting: Google Cloud

1.7 Module Description

1.7.1 User registration and login

Allows users to create an account on the website, and log in with their credentials.

1.7.2 Private Event management

Allows users to create and manage events, including options to book events, select other services, and view event schedules.

1.7.3 Public Event Management

Allows users to manage all the aspects of the event like attendees, sponsors, vendors and more.

1.7.4 Payment management

Allows users to make advance payments for events and other services, and provides options for full payment on completion of the event.

1.7.5 Event cancellation

Allows users to cancel events based on specified rules.

1.7.6 Gallery management

Allows admin to upload and manage images and videos for events and other services.

1.7.7 Report generation

Allows the admin to generate reports of events and bookings.

1.7.8 User profile management

Allows users to view and update their personal information, such as contact details and account information.

1.8 Other Information

1.8.1 Emailing Services

PHP Mailer with GMAIL

1.8.2 Payment Gateway

Razorpay Gateway

1.9 Future Scope

These additional features will enable the platform to provide a more comprehensive event management solution and attract a broader range of users. It will also enable the platform to stay competitive in the market and stay ahead of the ever-evolving technological landscape.

1. Incorporating virtual and augmented reality to enhance the user experience and event visualization.
2. Implementing a mobile app version of the platform for easy access and on-the-go event management.
3. Implementation of a backup mechanism for backing up of the database on a regular basis to different servers.
4. Chatbots or AI-based systems can be integrated later on for improved guidance and user interaction.

5. A section to advertise the public events can be incorporated.
6. Reminders can be sent to the client regarding the upcoming events.
7. Implementation of an automated scheduler which would reduce the time for confirmation of booking private events.

SOFTWARE REQUIREMENT SPECIFICATION (SRS)

2.1 Introduction

A Software Requirements Specification (SRS) is a comprehensive description of the features and functions that a software system is expected to provide. An SRS document typically includes details on the problem being solved, the goals and objectives of the software, user requirements, functional and non-functional requirements, and constraints and assumptions. The introduction of the Software Requirements Specification (SRS) provides an overview of the entire SRS with purpose, scope, definitions, acronyms, abbreviations, references and overview of the SRS. The aim of this document is to gather and analyze and give an in-depth insight of the proposed system by defining the problem statement in detail.

2.1.1 Purpose

The purpose of the project is to build a website that allows the user to create, book and manage events. The user will be asked to mention details like venue, no. of the attendees, event dates, services required, etc prior to booking the events. This platform aims to simplify the task of managing both, private and public events.

2.1.2 Intended Audience and Reading Suggestions

This document is intended for the software development team, website administrators, and other stakeholders involved in the development and deployment of the event management platform website.

2.1.3 Product Scope

The event management platform website provides a comprehensive solution for users to create and manage events. Users can create book events, select services like decorators, catering, photography, and make payments for these services. The platform also provides features like budget tracking, report generation, advertisement management, gallery management, user profile management, and an option to cancel events based on specified rules.

2.2 Overall Description

2.2.1 Product Perspective

2.2.1.1 Admin

The admin can manage the users and view the events created and monitor the overall working of the system. The admin is also able to create public events for a variety of users and manage the payment for a website.

2.2.1.2 User

The user can book events by entering information regarding venue, event date and time and selecting from the various available services provided by the service providers, using an easy-to-use interface provided on the website. Booked events can be canceled provided the business rules are followed.

The user can also buy tickets for the public events that will be available under the public events section.

It will have a very responsive interface to accommodate personal computers as well as common handheld devices such as Tablets and Mobile devices. The responsive interface will make it easier to view in all viewports.

2.2.2 Product Functions

The event management platform website provides the following functions:

Admin:

1. Report generation
2. Gallery management
3. User profile management

Private Events:

1. Create and cancel events
2. Book events, select services like decorations, catering, photography.
3. Make payments for services
4. Option to cancel events based on specified rules.

Public Events:

1. Purchase tickets for public events
2. Create public events by mentioning no. of tickets, per per ticket, etc.

2.2.3 User Classes and Characteristics

Users of the platform are expected to be comfortable using a web-based interface and have basic computer skills.

2.2.4 Operating Environment

The event management platform website is a web-based solution that requires an internet connection to access. The platform is designed to be compatible with modern web browsers and will be hosted on a secure server.

2.2.5 Design and Implementation Constraints

1. The website must be mobile-responsive.
2. The platform must use secure methods for transmitting and storing data.
3. Only the admin has full authority to use the software.

2.2.6 User Documentation

The event management platform website will include comprehensive user documentation to help users understand how to use the platform effectively.

2.2.7 Assumptions and Dependencies

The platform will use secure methods for transmitting and storing data. Users must have internet connection, basic computer skills and be comfortable using a web-based interface.

2.3. External Interface Requirements

2.3.1 User Interfaces

The website will have a user-friendly interface that is easy to navigate and understand. The website will have options for booking events, selecting services, and making payments. Users will have access to a personal profile where they can manage their information and event details.

2.3.2 Hardware Interfaces

The system requires the following hardware:

1. Printer

2.3.3 Software Interfaces

This system uses the support of the following software:

1. Razorpay Payment Gateway
2. PHPMailer

2.3.4 Communications Interfaces

This is a web-based system and communication is done through HTTPS and SMTP protocol.

2.4. System Features

2.4.1 Public Event booking and management

2.4.1.1 Description and Priority

Admin can create public events like conferences, concerts, meetings, etc. as per the user requirements. The no. of tickets, price per ticket, admin commission can be mentioned during event creation.

2.4.1.2 Stimulus/Response Sequences

Admin enters the event details like type of event, event dates, venue along with the no. of tickets, price per ticket, etc.

Created events will be available to the users. The users can buy the tickets for the desired events.

2.4.2 Private Event booking and management

2.4.2.1 Description and Priority

Users can book events and select other services like decorations, catering and photography. The platform provides features like budget tracking, and advertisement management. Users can manage their events, view details, and make changes if needed.

2.4.2.2 Stimulus/Response Sequences

System displays the various services available to the user, user inputs event type, event date/time, venue etc.

Users can modify the previously submitted booking requests and the system will send data for the scheduler to work with.

2.4.3 User profile management

2.4.3.1 Description and Priority

Users can manage their personal information and event details in their personal profile. The platform provides options to view and update personal information, view booked events, and manage event details. Least Priority.

2.4.4 Report Generation

2.4.4.1 Description and Priority

The admin will be able to generate the detailed report of each organized event under the report generation section. The report will include the number of guests who attended the event, overall event experience, etc.

2.4.4.2 Stimulus/Response Sequences

The system takes all the event statistics as input. The system generates a report using the statistics and stores it in the system which is also available for the admin.

2.4.5 Payment management

2.4.5.1 Description and Priority

The platform provides secure payment options for users to make payments.

2.4.5.2 Stimulus/Response Sequences

System displays the various payment options to the user.

Users choose from the available options to make payment.

2.4.6 Event Scheduling

2.4.6.1 Description and Priority

Admin can verify the dates and timings of the pre-booked events and send a confirmation to the user in order to avoid collision of events. The information of all the booked events will be mentioned in the event scheduler which can be viewed by the admin.

2.5. Other Nonfunctional Requirements

2.5.1 Performance Requirements

The website should be able to handle a large number of users and events simultaneously. The website should be fast and responsive, providing a seamless user experience.

2.5.2 Safety Requirements

The website should be secure and protect the personal information of users.

2.5.3 Security Requirements

The platform will use secure payment gateways and implement measures to protect against fraud and unauthorized access. The website will have a secure login system to protect user information and events.

2.5.4 Software Quality Attributes

The website should be visually appealing and easy to navigate. The website should be accessible on various devices and have a responsive design. The website should be user-friendly and provide a seamless experience.

2.5.5 Business Rules

- A. Users must agree to the terms and conditions of the platform before creating an account and booking events.
- B. The platform has rules for canceling events, which must be followed by users.

2.6. Other Requirements

The website administrator will have access to an admin dashboard for managing the website, user accounts, events, and other services.

2.7 Data Flow Diagram (DFD)

Data flow diagrams are also called data flow graphs. Data flow diagrams serve the purpose of clarifying system requirements and identifying major transformations. Data flow diagram shows the flow of data through the system. It is an important modeling tool that allows us to picture a system as a network of functional processes. Data flow diagrams are well-known and widely used for specifying the functions of an information system. They describe systems as collections of data that are manipulated by functions. Data can be organized in several ways. They can be stored in data repositories, they can flow in data flows, and they can be transferred to or from external environments. One of the reasons for the success of Data flow diagrams are that they can be expressed by means of an attractive graphical notation that makes them easy to use.

Symbols used for constructing data flow diagrams:

- Functional symbol-A function is represented using a circle. This symbol is called process or a bubble and performs some processing of input data.

- External entity-A Square defines a source or destination of system data. External entities represent any entity that supplies or receives information from a system but is not a part of the system.

- Data flow symbol-directed arc or arrow is used as data flow symbol. A dataflow symbol represents the data flow occurring between two processes or between an external entity and a process in the direction of the data flow arrow.

- Data store symbol-A data store symbol is represented using two parallel lines. A logical file can represent either a data-store symbol, which can represent either a data structure, or physical file on disk. Each data store is connected to the process by means of a data flow symbol. The direction of the data flow arrow shows whether data is being read from or written into the data store.

2.7.1. Context Flow diagram (CFD)

2.7.2. Level 1 DFD

- Admin

- User

SYSTEM MODELING

3.1 CLASS DIAGRAM

A Class diagram in the Unified Modelling Language is a type of static structure that describes the structure of a system by showing the system's classes, their attributes, operations and the relationships among the objects. The main purpose of class diagrams is to build a static view of an application. It is the only diagram that is widely used for construction, and it can be mapped with object-oriented languages. A class diagram is used to visualize, describe, document various different aspects of the system, and also construct executable software code.

A UML class diagram is made up of:

- A set of classes and
 - A set of relationships between classes
- Class Notations

A class notation consists of three parts:

- **Class Name:** The name of the class appears in the first partition.
- **Class Attributes:** Attributes are shown in the second partition. The attribute type is shown after the colon. Attributes map onto member variables (data members) in code.
- **Class Operations (Methods):** Operations are shown in the third partition.
 1. They are services the class provides.
 2. The return type of a method is shown after the colon at the end of the method signature.
 3. The return type of method parameters is shown after the colon following the parameter name.
 4. Operations map onto class methods in code.

Class Relationships

A class may be involved in one or more relationships with other classes.

Inheritance (or Generalization):

- Represents an "is-a" relationship.
- An abstract class name is shown in italics.
- SubClass1 and SubClass2 are specializations of Super Class.

- A solid line with a hollow arrowhead that points from the child to the parent class.

Aggregation:

A special type of association. It represents a "part of" relationship.

- Class2 is part of Class1.
- Many instances (denoted by the *) of Class2 can be associated with Class1.
- Objects of Class1 and Class2 have separate lifetimes.
- A solid line with an unfilled diamond at the association end connected to the class of composite.

Composition:

- A special type of aggregation where parts are destroyed when the whole is destroyed.
- Objects of Class2 live and die with Class1.
- Class2 cannot stand by itself.
- A solid line with a filled diamond at the association connected to the class of composite

Dependency:

- Exists between two classes if the changes to the definition of one may cause changes to the other (but not the other way around).
- Class1 depends on Class2
- A dashed line with an open arrow

3.2 USE CASE DIAGRAM

A use case diagram is a graphic depiction of the interactions among the elements of a system. It is a methodology used in system analysis to identify, clarify, and organize system requirements. A use case diagram does not show the detail of the use case, it only summarizes some of the relationships between use case and the actors. In particular, the diagram does not show the order in which steps are performed to achieve the goals of each use case. It deals only with the functional requirements of the system. Use case diagrams are usually referred to as behavior diagrams, which is used to describe a set of actions that systems should or can perform in collaboration with one or more external users of the system i.e., Actors. Each use case should provide one or more observable and valuable results to the actor. The purpose of a use case diagram is to capture core functionalities of a system and visualize the interactions of various things called as actors with the use case. A use case consists of use cases, persons, or various things that are invoking the features called as actors and the elements that are responsible for implementing the use cases. Use case diagrams capture the dynamic behavior of the live system. Use case diagrams are responsible for visualizing the external things that interact with part of the system. A use case diagram should be as simple as possible. A use case diagram should be complete. A use case diagram should represent all interactions with use cases. If there are too many use cases or actors, only the essential use cases should be represented. A use case diagram should describe at least a single module of a system. If the use case diagram is large, then it should be generalized. The name of the actor and use case should be meaningful and relevant to the system. Interaction of an actor with the use case must be defined clearly and in an understandable way. Annotation must be used wherever they are required. If a use case or an actor has multiple relationships, then only significant interactions must be displayed.

3.3 SEQUENCE DIAGRAM

UML sequence diagram model is the flow of logic within the system in a visual manner, enabling both to document and validate the logic and are commonly used for both analysis and design purposes. It is the most popular UML artifact for dynamic modeling which focuses on identifying the behavior within the system. Sequence diagrams are typically associated with use case realizations in the logical view of the system under development. Sequence diagrams are sometimes called event diagrams and event scenarios. A sequence diagram shows, as parallel vertical lines different processes or the objects that live simultaneously and as horizontal arrows, the messages exchanged between them, in the order in which they occur. This allows the specification of simple runtime scenarios in a graphical manner. A sequence diagram shows object interactions arranged in time sequence, it depicts the objects and classes involved in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of the scenario.

DATABASE MODELING

4.1 ER Diagram

An Entity Relationship Diagram (ERD) is a visual representation of different entities within a system and how they relate to each other. Here are the geometric shapes and their meaning in an E-R Diagram

- Rectangle: Represents Entity sets.
- Ellipses: Attributes
- Diamonds: Relationship Set
- Lines: They link attributes to Entity Sets and Entity sets to Relationship Set
- Double Ellipses: Multivalued Attributes
- Dashed Ellipses: Derived Attributes
- Double Rectangles: Weak Entity Sets
- Double Lines: Total participation of an entity in a relationship set

ER diagram has three main components:

1. **Entity:** An entity is an object or component of data. An entity is represented as a rectangle in an ER diagram. **Weak Entity:** An entity that cannot be uniquely identified by its own attributes and relies on the relationship with other entities is called a weak entity. The weak entity is represented by a double rectangle
2. **Attribute:** An attribute describes the property of an entity. An attribute is represented as Oval in an ER diagram. There are four types of attributes:
 - a. **Key attribute:** A key attribute can uniquely identify an entity from an entity set. Key attribute is represented by oval same as other attributes however the text of key attribute is underlined.
 - b. **Composite attribute:** An attribute that is a combination of other attributes is known as a composite attribute.
 - c. **Multivalued attribute:** An attribute that can hold multiple values is known as a multivalued attribute. It is represented with double ovals in an ER Diagram.
 - d. **Derived attribute:** A derived attribute is one whose value is dynamic and derived from another attribute. It is represented by a dashed oval in an ER Diagram.

3. **Relationship:** A relationship is represented by diamond shape in ER diagram, it shows the relationship among entities. There are four types of relationships:
- a. **One to One Relationship:** When a single instance of an entity is associated with a single instance of another entity then it is called one to one relationship.
 - b. **One to Many Relationship:** When a single instance of an entity is associated with more than one instance of another entity then it is called one to many relationship.
 - c. **Many to One Relationship:** When more than one instance of an entity is associated with a single instance of another entity then it is called many to one relationship.
 - d. **Many to Many Relationship:** When more than one instance of an entity is associated with more than one instance of another entity then it is called many to many relationship.

Total Participation of an Entity set: A Total participation of an entity set represents that each entity in an entity set must have at least one relationship in a relationship set.

ER Diagram

4.2 Table Description

A table is an arrangement of data in rows and columns, or possibly in a more complex structure. A table is a collection of related data held in a table format within a database. The database management system (DBMS) is the software that interacts with end users, applications, and the database itself to capture and analyze the data. A database consists of one or more tables. Each table is made up of rows and columns. Each row in a relational table is uniquely identified by a primary key. This can be by one or more sets of column values. In most scenarios it is a single column, such as student ID. Every relational table has one primary key. Its purpose is to uniquely identify each row in the database. No two rows can have the same primary key value. The practical result of this is that you can select every single row by just knowing its primary key.

Table Name: **users**

Column	Type	Size	Constraints	Description
id	int	11	primary key, auto incremented	Unique identifier for a user
fname	varchar	25	Not null	Name of the user
lname	varchar	25	Not null	Last Name of the user
email	varchar	50	unique	Email address of the user
passwords	varchar	255	Not null	Password for the user's account
phone	varchar	11	Not null	Phone number of the user
images	varchar	255		Profile image of the user if any
roles	varchar	10		Type of user, such as "user", "admin" or "service"

Table Name: **bookings**

Column	Type	Size	Constraints	Description
booking_id	int	11	primary key, auto incremented	Unique identifier for a booking
booking_date	datetime			Date and time when the booking was made
category	varchar	25		Categories of events like Marriage, Birthday etc.
startDate	datetime			Start date of the event
endDate	datetime			End date of the event
venue	varchar	255		Venue of the event
user_id	int	11	foreign key (User.id), on delete cascade	Foreign key to the corresponding user

approval_status	tinyint	1		Status of the event whether rejected or approved
------------------------	---------	---	--	--

Table Name: **events**

Column	Type	Size	Constraints	Description
id	int	11	primary key, auto incremented	Unique identifier for an event
name	varchar	255		Name of the event
description	varchar	50		Description of the event
venue	varchar	255		Venue of the event
start_datetime	datetime			Start date of the event
end_datetime	datetime			End date of the event

banner	varchar	255		Location pointing to the banner for event
no_of_tickets	int	11		Total number of tickets available for the event
price_per_ticket	int	11		Price per ticket for the event
admin_percentage	float			Percentage of commission for the Admin

Table: **service**

Column	Type	Size	Constraints	Description
id	int	10	primary key, auto incremented	Unique identifier for a service
service_name	varchar	50		Name of the service
contact	varchar	50		Contact detail of service provider

Table: **service_catering**

Column	Type	Size	Constraints	Description
id	int	11	primary key, auto incremented	Unique identifier for a catering service
service_provider_id	int	11	foreign key (service.id)	Foreign key to the corresponding service
meals	varchar	30		Meals (Breakfast, Lunch or Dinner)
package	varchar	30		Package (Standard, Deluxe or Premium)
item_name	varchar	30		Name of items provided
price	int	11		Price of Particular item

Table: **booked_photography**

Column	Type	Size	Constraints	Description
booking_id	int	11	foreign key (bookings.id)	Foreign key to the corresponding booked event
drone	boolean			Whether or not the service includes drone photography

Table: **booked_arrangements**

Column	Type	Size	Constraints	Description
booking_id	int	11	foreign key (bookings.id)	Foreign key to the corresponding booked event
decorations	varchar	255		The description on how the decorations or arrangements should be

Table: **booked_catering**

Column	Type	Size	Constraints	Description
id	int	11	primary key, auto incremented	Unique identifier for a catering service
booking_id	int	11	foreign key (bookings.id)	Foreign key to the corresponding booked event
service_provider_id	int	11	foreign key (service.id)	Foreign key to the corresponding service provider
breakfast_plates	int	11		Number of plates required of breakfast
lunch_plates	int	11		Number of plates required of lunch
dinner_plates	int	11		Number of plates required of dinner
total_price	decim al	10,2		Price of Particular item

Table: **gallery**

Column	Type	Size	Constraints	Description
id	int	11	primary key, auto incremented	Unique identifier for the media files
path	varchar	255		The pathname of the media file
title	varchar	100		Title or Description for the media files
type	varchar	11		Type of media file whether image or video

Table: **ticket_bookings**

Column	Type	Size	Constraints	Description
id	int	11	primary key, auto incremented	Unique identifier for a ticket sales
user_id	int	11	foreign key (users.id)	Foreign key to the corresponding user
event_id	int	11	foreign key (events.id)	Foreign key to the corresponding public event
name	varchar	50		Name of the user booking the ticket
email	varchar	50		Email of the user booking the ticket
tickets	int	11		Number of tickets
total	double			Total amount payable
payment_id	varchar	100		Payment ID generated by gateway

payment_status	varchar	50		Payment Status returned by gateway
-----------------------	---------	----	--	------------------------------------

TESTING AND VALIDATION

5.1 INTRODUCTION

Testing is the major quality control method used during software development. It is the basic function to detect errors. During the requirement analysis and design the output of the document that is usually textual and non-executable after the coding phase the computer programs are available that can be executed for testing purpose. The goal of testing is to uncover requirement, design and coding errors in the program. Testing determines whether the system appears to be working according to the specifications. It is the phase where we try to break the system and we test the system with real scenarios at a point. The implementation is the final and important phase. It involves user-training system testing.

In order to ensure successful running of the proposed system, the user tests the system and changes are made according to their needs. The testing involves the testing of the developed system using various kinds of data, while testing errors are noted and correctness is made.

5.2 TESTING OBJECTIVES

The objectives of testing are:

- Testing is the process of executing a program with the intent of finding errors.
- A successful test case is one that uncovers un-yet-discovered errors.

System testing is a stage of implementation, which is aimed at ensuring that the system works accurately and efficiently as per the user need, before the live operation commences. As stated, before testing is vital to the success of a system. System testing makes a logical assumption that if all the parts of the system are correct, the goal will be successfully achieved. A series of test are performed before the system is ready for the user acceptance test.

5.3 TESTING METHODS

System testing is the stage of implementation. This is to check whether the system works accurately and efficiently before live operation commences. Testing is vital to

the success of the system. A series of tests are performed for the proposed system to be ready for the user acceptance testing.

5.4 TESTING STEPS

5.4.1 Unit testing

Unit testing is a level of software testing where individual units/components of software are tested. The purpose is to validate that each unit of the software performs as designed. A unit is the smallest testable part of any software. It usually has one or few inputs and usually a single output.

5.4.2 Integration testing

Integration testing is a level of software testing where individual units are combined and tested as a group. The purpose of this level of testing is to expose faults in the interaction between integrated units. Test drivers and test stubs are used to assist in integration testing. It is performed to expose defects in the interfaces and in the interactions between integrated components or systems.

5.4.3 Validation

Validation testing can be defined in many ways, but a simple definition is that the validation succeeds when the software functions in the manner that is expected by the client. After a validation test has been conducted, one of the three possible conditions exists. The function or performance characteristics confirm to specifications and are accepted. The deviation from specification is uncovered and a deficiency list is created. Proposed system under consideration has been tested by using validation test and found to be working satisfactory.

5.4.4 Output testing

After performing the validation, the next step is output testing of the proposed system, since no system could be useful if it does not produce the required output in a specific format. The output format on the screen is found to be correct. The format

was designed in the system design time according to the user needs. For the hard copy also, the output comes as per the specified requirements by the user. Hence output testing did not result in any correction for the system.

5.4.5 User acceptance testing

Acceptance testing is the level of software testing where a system is tested for a acceptability. It is a formal testing with respect to other needs, requirements conducted to determine whether or not a system satisfies an acceptance criteria and to enable the users or other unauthorized to determine whether or not to accept a system.

5.5 TEST CASES

Home Page

The screenshot shows the home page of the Event-Ease website. At the top, there is a navigation bar with the logo 'Pictureque' on the left and links for 'Home', 'Events', 'Gallery', 'Contact', and 'About' in the center. A 'Sign In' button is located on the right. Below the navigation bar, the main content area features a large section titled 'Turn your event experiences to a whole new level'. This section includes a sub-headline 'We work with the best associates to provide you with a better event experience.' and a list of six bullet points arranged in two columns: 'Professional Approach', 'Creative', 'Payment Security', 'Flexible', 'Experienced', and 'Budgeting skills'. To the right of this text is a large image of two hands, one with intricate henna designs, holding a string of colorful beads. Below this main section, there is a 'Our Team' section with a sub-headline 'Pictureque is a team of experienced and passionate photographers who specialize in capturing beautiful moments at your events. We pride ourselves on our ability to capture the essence of your special day, from weddings to corporate events and everything in between. Our team consists of skilled photographers who bring their unique vision and creative talent to every'. This section is accompanied by two small portrait photos of team members: a man with short brown hair and a woman with long dark hair wearing a hat.

The screenshot shows the 'Add Event' modal in the Event-Ease application. The modal is a white box with a close button (X) in the top right corner. It contains the following fields:

- Name:** A text input field containing 'Enigma 22'.
- Description:** A text area containing 'A mathematical quiz and group discussion.'
- Start datetime:** A datetime picker showing '09-05-2023 10:30 AM'.
- End datetime:** A datetime picker showing '09-05-2023 04:30 PM'.
- Venue:** A text input field containing 'Kozhikode,Kerala'.
- Banner:** A text input field.

The background shows a table of events with columns: #, NAME, DESCRIPTION, TIME, VENUE, NO. OF TICKETS, PRICE PER TICKET, and ACTIONS. A 'Delete' button is visible in the ACTIONS column.

5.5.7.2 Users

The screenshot shows the 'Add User' modal in the Event-Ease application. The modal is a white box with a close button (X) in the top right corner. It contains the following fields:

- Name:** A text input field.
- Email:** A text input field.
- Phone:** A text input field.
- Role:** A dropdown menu.
- Actions:** A text input field.

The background shows a table of users with columns: Name, Email, Phone, Role, and Actions. A 'Delete' button is visible in the ACTIONS column.

5.5.7.2.1 Edit Users

Test Case ID	Test Condition	Expected Output	Result
1	First Name field is empty	Please fill out this field	Success
2	Last Name field is empty	Please fill out this field	Success
3	Email field is empty	Please fill out this field	Success
4	Phone field is empty	Please fill out this field	Success
5	Wrong email format is entered	Please enter valid email address	Success
6	User Role is not selected	Please select an item in list	Success

The screenshot shows the 'Add User' modal form in the Event-Ease application. The form contains the following fields:

- Name:** Siril
- Last Name:** Joseph
- Email:** siriljoseph02@gmail.com
- Phone:** 08078196920
- Role:** A dropdown menu with a warning message: 'Please select an item in the list.'

At the bottom of the form is a 'Save Changes' button. The background shows a sidebar with navigation links (Dashboard, User Management, Bookings, Public Events, Media Manager) and a table of existing users with columns for Name, Role, and Actions.

5.5.7.2.2 Add User

Test Case ID	Test Condition	Expected Output	Result
1	First Name field is empty	Please fill out this field	Success
2	Last Name field is empty	Please fill out this field	Success
3	Email field is empty	Please fill out this field	Success
4	Phone field is empty	Please fill out this field	Success
5	Wrong email format is entered	Please enter valid email address	Success

The screenshot shows the 'Add User' modal form with all fields filled. The fields are:

- First Name:** Siril
- Last Name:** Joseph
- Email:** siriljoseph02@gmail.com
- Phone:** 08078196920
- Role:** User

At the bottom of the form are 'Add' and 'Cancel' buttons. The background shows the same sidebar and user table as the previous screenshot.

5.5.7.3 Media Manager

CONCLUSION

In conclusion, the event management system offers a wide range of features for private and public events. It provides a simple and efficient way to book private events, purchase tickets for public events, and manage various aspects of the events. Moreover, the system allows service providers such as catering, photography, and decorations to utilize the platform, enabling them to provide a more comprehensive solution to their customers. The platform has the potential to streamline the event planning process, providing a more seamless experience for all involved. Overall, the event management system represents a significant step forward in the field of event planning.

FUTURE SCOPE

Some additional features will enable the platform to provide a more comprehensive event management solution and attract a broader range of users. It will also enable the platform to stay competitive in the market and stay ahead of the ever-evolving technological landscape.

1. Incorporating virtual and augmented reality to enhance the user experience and event visualization.
2. Implementing a mobile app version of the platform for easy access and on-the-go event management.
3. Implementation of a backup mechanism for backing up of the database on a regular basis to different servers.
4. Chatbots or AI-based systems can be integrated later on for improved guidance and user interaction.
5. A section to advertise the public events can be incorporated.
6. Reminders can be sent to the client regarding the upcoming events.
7. Implementation of an automated scheduler which would reduce the time for confirmation of booking private events.
